SUMMARY

Full-stack engineer who builds AI systems that ship—LLM agents, real-time tools, and the production backends that keep them reliable. MS in Computer Science (3.91 GPA). Most recently the developer inside a cardiovascular practice, where I built a production automation platform end-to-end and **cut a 20-minute manual clinical workflow to 2–3 minutes**. I work across the stack in Python/FastAPI and React/TypeScript, with a focus on agent authorization, evaluation, and making AI features safe enough to trust in production.

TECHNICAL SKILLS

Languages: Python, TypeScript, JavaScript, SQL

AI & Agents: LLM integration (Anthropic, OpenAI, Gemini), tool/function-calling loops, agentic orchestration, RAG / retrieval, evaluation & behavioral testing, human-in-the-loop workflows, SSE streaming

Backend & APIs: FastAPI, Flask, Node.js, Express, REST API design, authentication, idempotency, rate limiting, async/queue-based processing, fault tolerance

Frontend: React, Next.js, TypeScript, Tailwind CSS

Data & Infrastructure: PostgreSQL, MongoDB, Redis · Docker, CI/CD, AWS S3, cloud deployment (Vercel, Render), structured logging, telemetry, monitoring

EXPERIENCE

Heart, Artery & Vein Center of Fresno, Inc. — Fresno, CA

Aug. 2025 – Present

Full-Stack Developer (AI-Focused)

- Designed and implemented a production automation platform used in daily operations, reducing a 20-minute manual workflow to 2–3 minutes per execution.
- Built fault-tolerant backend services using Python with asynchronous workers, queue-based execution, and object-storage-driven workflows.
- Implemented telemetry, audit logs, and access tracking to ensure system observability, reliability, and operational accountability.

California State University, Fresno

Jan. 2025 – May 2025

Hibiki AI - Graduate Research Assistant - JavaScript, React

- Developed React-based operational interfaces for interacting with distributed backend services.
- Designed secure and reliable communication patterns between frontend clients and backend systems.

YouGov Inc.

Sep. 2021 – July 2023

Python Developer

- Built automation tools that reduced manual coding processes from 6–20 hours to single-click operations.
- Optimized internal data pipelines using asynchronous processing and caching. Designed reusable modules to improve system consistency and maintainability across projects.

PROJECTS

Delegate — Transparent AI Agent for Gmail & Google Calendar

[Live](#) | [Code](#) · React, TypeScript, Vercel AI SDK, Node.js, Express, Server-Sent Events, Google OAuth 2.0, Gmail API, Google Calendar API, Tailwind CSS

- Built a multi-provider AI agent (Anthropic, OpenAI, Gemini) on a unified tool-calling loop, exposing 10 Gmail/Calendar REST endpoints for natural-language inbox and schedule control with bring-your-own-key model selection per request.
- Designed **classifier-gated execution**: every tool call is risk-scored before running—low-risk reads auto-execute, high-risk writes await Promise-based step-up approval over SSE with a 30-second auto-deny timeout (no polling, no WebSockets).
- Deployed end-to-end on Vercel + Render with direct Google OAuth 2.0 (refresh-token rotation), server-side scope enforcement before each API call, and a live action log streamed over 8 SSE event types.

Koda — AI Coding Agent

[Live](#) | [Code](#) · React 19, TypeScript, FastAPI, PostgreSQL, WebSocket, Anthropic Claude API, Tree-sitter, Monaco Editor, Zustand, JWT

- Architected multi-phase agentic orchestration (understand → plan → execute → approve) with a recursive tool-use loop across 7 tools (file I/O, grep, terminal, Tree-sitter AST indexing) for autonomous multi-step coding tasks.
- Implemented a human-in-the-loop safety workflow—atomic change staging and unified diffs requiring explicit review and approval before any write, keeping agent actions transparent and reversible.
- Streamed agent reasoning over FastAPI WebSockets with sub-second latency and **cut LLM API cost 40%** via cost-optimized model routing (Haiku/Sonnet).

AuthZ Platform — Authorization & Approval Workflow System

[Live](#) | [Code](#) · React 19, TypeScript, FastAPI, PostgreSQL, SQLAlchemy 2.0, JWT, Zustand, React Query, Tailwind CSS v4, Pytest

- Architected a dual authorization engine—RBAC (user→role→permission) and PBAC (JSON policy documents with wildcard patterns and attribute conditions)—with deny-overrides-allow, priority-based evaluation matching AWS IAM / Google Zanzibar semantics.
- Built an access-request finite state machine (Pending → Approved/Denied → Expired) with an approver inbox, auto-provisioning on approval, and an immutable audit trail with CSV/JSON export.
- Secured it with JWT refresh-token rotation (unique JTI, SHA-256 invalidation) and multi-tenant org-scoped isolation—54 REST endpoints, 12 tables, 24 passing tests.

EDUCATION

California State University, Fresno

Aug. 2023 – May 2025

MS in Computer Science - 3.91/4.0

KJSIEIT, Mumbai University

Aug. 2016 – Oct. 2020

Bachelor's in Engineering, Information Technology
